

FITTING AND MAINTENANCE INSTRUCTIONS

PURASTREAM GU7H

- 1). Remove the handset from the box and its plastic bag
- 2). In the plastic bag there is a washer, please keep this safe as you may well require it during installation
- 3). Unscrew the handle anti clockwise and remove the gel cartridge.
- 4). At the bottom of the gel cartridge is a screw slot. This controls the amount of vitamin c and aroma that is released.
We suggest that you unscrew the valve by 2 whole turns. You may wish to adjust at a later stage.
- 5). Replace the gel cartridge with the screw valve pointing towards the hose. There are indicator arrows on the cartridge.
- 6). Re attach the handle to the head tightening clockwise.

Principles Of Filter Control

Discharge Control

More Discharge When Turned Left

DO NOT Turn More Than Twice

- 7). Unscrew your existing handset from the hose in your shower.
- 8). Connect the Purastream handset to the hose. You may need to use the sealing washer provided with the handset.
- 9). Place back in the wall bracket/slide bar switch on and enjoy.
- 10). It can take up to 30 minutes of water running through the unit to obtain the full benefits of the vitamin c and aroma gel as the water has to mix with the gel inside the cartridge.

ROUTINE MAINTENANCE

Your Purastream shower handset consists of the following parts shown below. You will routinely need to check the gel cartridge, the non-woven filter and the spray plate. An assembly list follows then the maintenance section.

PuraStream

The unit goes together in the following order

- 1). Place the spray plate into the screw cap holder.
- 2). Insert the o ring.
- 3). Place the non-woven filter into the recess in the ceramic ball cartridge.
- 4). Place the ceramic ball cartridge into the screw on holder with the non woven filter facing towards the spray plate.
- 5). Screw the holder to the head.
- 6). Place the gel cartridge into the handle with the adjustment screw end facing towards the hose.
- 7). Screw the handle to the head.

Below are listed the 4 main maintenance requirement.

- 1). Your vitamin c and aroma cartridge will run out. It should last between 2-3 months but will obviously depend on usage and water pressure. The main indicator that the cartridge has run out will be the Aroma. The shower water will no longer carry that zingy citrus smell so it will need replacing.
- 2). Your non woven filter can get blocked thus reducing the flow and performance of the head.
- 3). Your spray plate can get furred up with limescale and other such deposits and will require cleaning.
- 4). The ceramic ball cartridge will become less efficient so it is worth changing on a yearly basis

CHECKING YOUR CARTRIDGE

Remove the cartridge from the handset by unscrewing the handle from the head by turning anti clockwise. If the cartridge is clear as per the diagram below it will need replacing.

Full cartridge

Empty cartridge

CHECKING THE NON WOVEN FILTER

The non woven filter can be checked by unscrewing the head holder ring and removing the filter. This can be replaced with a new one or you can attempt to wash it. Below is a worse case scenario. Thus far in the UK my filter has just captured small-particles. I have neither washed it or

changed it.

CHECKING THE SPRAY PLATE

The spray plate will need cleaning and at worse replacing. Symptoms can be limited water flow or the water jets not flowing freely from the head but vibrating of in different angles. Just remove the plate and use an of the shelf cleaner for dissolving lime scale. Then replace. After time I am sure the minute triangular holes will wear and the plate will need replacing.
